it's the last tutorial! :D

- topics: --<br>- equivalence relations
	- equivalence classes
	- modular arithmetic (hidden in the problems)

**Definition 7.2.1.** An equivalence relation R on a set S is a relation (that is,  $R \subseteq S \times S$ ), such that: (a) For any  $x \in S$ ,  $(x, x) \in R$  (**reflexive** property). (b) For any  $x, y \in S$ , if  $(x, y) \in R$ , then  $(y, x) \in R$  (symmetric property). (c) For any  $x, y, z \in S$ , if  $(x, y) \in R$  and  $(y, z) \in R$ , then  $(x, z) \in R$  (**transitive** property).

1) (a) Prove directly, that the following relation, on the set of integers, is an equivalence relation.

 $a \equiv b$  if and only if  $a - b$  is divisible by 4.

Refkrice: is 
$$
a \equiv a
$$
  $\forall a \in \mathbb{Z}$ ?  
\n $yes!$   $0-a=0$  which is divisible by 4.  
\n $3yawetric!$  does  $a \equiv b \Rightarrow b \equiv a?$   
\n $yes!$  if  $a \equiv b$ , then  $a-b = 4k$   $44 \Rightarrow we k \in \mathbb{Z}$ .  
\n $10xsine$ :  $doos$   $a \equiv b \Rightarrow b = c$   $0 \equiv a$ .  
\n $10xsine$ :  $doos$   $a \equiv b$ ,  $b = c \Rightarrow a = \frac{\pi}{2}c$ .  
\n $9e s!$  if  $a \equiv b$ ,  $b = c$   
\n $9e s$   $0 \equiv a$ .  
\n $9e s$   $0 \equiv a$ .  
\n $9e s$   $0 \equiv a$ .  
\n $3e$   $a = b \Rightarrow b = c$   
\n $9e s$   $0 \equiv a$ .  
\n $10xsinh e$   $0 \Rightarrow a = c$  if  $a \Rightarrow b = c$   
\n $0 = 2(a-bfbe-c)$   
\n $= 4k+4k+4k+4k+8$   
\n $3e$   $a = c$  if  $a \Rightarrow b = 4k$   $4e$   $3e$   $a = 2$ .

(b) Show that if two integers satisfy the relation in part (a), then they have the same remainder when divided by 4 (refer to Theorem 6.1.2 and Exercise 6.4.7).

Theorem 6.1.2. (The Division Algorithm) If  $a, b \in \mathbb{N}$ , then there is a unique pair of integers, q and r, with  $q \ge 0$  and  $0 \le r < b$ , such that  $a = q \cdot b + r$ 

 $(q$  is called the **quotient**, and  $r$  the **remainder**).

**6.4.7.** There are ways to generalize the Division Algorithm (Theorem  $6.1.2$ ), so that it can be applied to all integers (both positive and negative). Here is one possible generalization.

> If  $a, b \in \mathbb{Z}$ , with  $b \neq 0$ , then there is a unique pair of integers, q and r, with  $0 \leq r < |b|$ , such that  $a = q \cdot b + r$ .

Note that the remainder is still required to be nonnegative, so for instance, if we divide  $-21$  by  $-4$ , the quotient is 6 and the remainder is 3, as  $-21 = 6 \cdot (-4) + 3$ .

(a) Find the quotient and the remainder, obtained when dividing  $\boldsymbol{a}$  by  $\boldsymbol{b}.$ 

•  $a = 27$  and  $b = -8$ . •  $a = 5$  and  $b = -7$ .  $\bullet\;\; a=-15$  and  $b=2.$ •  $a = -4$  and  $b = 9$ . •  $a = -36$  and  $b = -9$ .

 $\mathbf{I}$ 

(b) Prove the generalized version of the Division Algorithm given above. (Hint: Instead of using induction, proceed by cases, and refer to Theorem  $6.1.2$  )  $a \equiv b$  if and only if  $a - b$  is divisible by 4.

$$
\text{Suppse} \qquad \text{4|a-b}.
$$

by the division algorithm,  
there exist unique integers 
$$
q_{a_1}v_{a_2}
$$
  
and  $q_{b_1}r_{b_1}$  such that

$$
a = q_a \cdot 4 + r_a
$$
 04  $8 \cdot 16 + 4$ 

(you don't have to actually do 6.4.7 as an exercise)  $\int_{\mathcal{L}}$  and  $\int_{\mathcal{L}}$  b.  $(4 + r)$ 

$$
S
$$

$$
\mathcal{L}_{\mathsf{H}}\circ\mathcal{L}
$$

 $\bullet\;\; a = -36$  and  $b = -9.$ 

Show  $r_a$  =  $r_b$ :

(b) Prove the generalized version of the Division Algorithm given above.  $(\underline{\text{Hint}}\text{: Instead of using induction, proceed by cases, and refer to Theorem 6.1.2.)}$ 

41 a-b  
\n
$$
41 a-b
$$
\n
$$
41 a-ab + r a - r b
$$
\n
$$
51 a c + 14 (q a - q b) + 14 (q a - q b) + 14 (q a - q b)
$$
\n
$$
41 r a - r b
$$
\n
$$
65 - 3 \le r a - r b \le 3
$$
\n
$$
71 a - r b
$$
\n
$$
72 - r b
$$
\n
$$

$$
\n
$$
81 - r b
$$
\n
$$
81 - r b
$$
\n
$$
82 - r b
$$

2) Define, on the set of integers, the following equivalence relation.

 $k \sim l$  if and only if  $|k| = |l|$ .

(a) Prove that the above relation is indeed an equivalence relation.

\n- \n
$$
\text{Rafkive: } |k| = |k|
$$
\n $\forall k \in \mathbb{Z}$ \n
\n- \n $\text{Symmetric:} \quad \text{if} \quad |k| = |k|$ , then  $\text{left:} \quad \forall k, k \in \mathbb{Z}$ \n
\n- \n $\text{Tussitive:} \quad \text{if} \quad |k| = |k|$ , and  $|l| = |m|$ , then  $|k| \ge |m|$ \n $\forall k, l, m \in \mathbb{Z}$ \n
\n

(b) Describe the equivalence classes for this relation.

**Definition 7.3.1.** Let *R* be an equivalence relation on a set *S*, and 
$$
x \in S
$$
.

\nThe equivalence class of *x* is the set of all elements  $y \in S$ , which are equivalent to *x*:

\n
$$
\{y \in S : (x, y) \in R\}.
$$
\nWe denote the equivalence class of *x* by  $[x].$ 

\n
$$
\begin{bmatrix}\n0 \\
7\n\end{bmatrix}\n\begin{bmatrix}\n-\sqrt{3} \\
-\sqrt{2}\n\end{bmatrix}.
$$

\n
$$
\begin{bmatrix}\n1 \\
7\n\end{bmatrix}\n\begin{bmatrix}\n-\sqrt{3} \\
-\sqrt{1} \\
\end{bmatrix}.
$$

\n
$$
\begin{bmatrix}\n1 \\
7\n\end{bmatrix}\n\begin{bmatrix}\n-\sqrt{3} \\
-\sqrt{1} \\
\end{bmatrix}.
$$

\n
$$
\begin{bmatrix}\n1 \\
7\n\end{bmatrix}\n\begin{bmatrix}\n-\sqrt{3} \\
-\sqrt{1} \\
\end{bmatrix}.
$$

\n
$$
\begin{bmatrix}\n1 \\
7\n\end{bmatrix}\n\begin{bmatrix}\n-\sqrt{3} \\
-\sqrt{1} \\
\end{bmatrix}.
$$

\n
$$
\begin{bmatrix}\n1 \\
7\n\end{bmatrix}\n\begin{bmatrix}\n-\sqrt{3} \\
-\sqrt{1} \\
\end{bmatrix}.
$$

\n
$$
\begin{bmatrix}\n1 \\
7\n\end{bmatrix}\n\begin{bmatrix}\n-\sqrt{3} \\
-\sqrt{1} \\
\end{bmatrix}.
$$

3) Let  $f:A\to B$  be an arbitrary function. Prove that the relation

 $x \sim y$  if and only if  $f(x) = f(y)$ ,

on the set  ${\cal A},$  is an equivalence relation.

 $\sim$   $\sim$ 

 $Refkwe = f(s) = f(s)$   $\forall x \in A$ .

 $S_{\text{Y}}$  and  $f(x) = f(x) = f(y)$ , then  $f(y) = f(x)$   $\forall x, y \in A$ .

Transitive: if  $F(x)=f(y)$  and  $f(y)=f(z)$ , then  $f(z)=f(z)$   $\forall x,y,z \in A$ .
